

COMPLETE COMMERCIAL SYSTEMS

Simplify your project design and installation with a RainFlo complete rainwater collection system. The RainFlo complete commercial systems are designed with premium components for optimal performance in commercial applications, and includes water storage, filtration, pumping, treatment, and hardware/accessories.

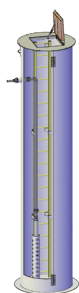

UNDERGROUND STORAGE TANKS

RainFlo single wall, underground, fiberglass reinforced plastic (FRP) storage tanks set the standard for custom designed and made-to-order storage tank solutions. Our factory designed and engineered tank anchoring systems ensure RainFlo FRP tanks can be buried in any environment, including high water table applications. Tank sizes and capacities range from 4' to 12' diameter and individual storage volumes up to 50,000 gallons. Multiple tanks can be plumbed together to achieve system capacities over 50,000 gallons.

TANK PRE-FILTRATION

The RainFlo integrated filter and vault system is a single unit that provides an optimal pre-filtration solution for underground rainharvesting and stormwater management applications. The fiberglass vault is compact, lighter weight, and can be rotated 360° in relation to the storage tank, simplifying installation. The vault houses the high performance GRAF Optimax XXL filter capable of flow rates over 2000 GPM and accommodates 10", 12", and 16" pipe connections. The Optimax XXL features self-cleaning spray heads and a stainless steel 350 micron filter insert that reduces maintenance.

PUMPING

The fiberglass wet well houses the submersible pump keeping it submerged in water for effective cooling and run-dry prevention. The larger dedicated access makes pump removal and maintenance easier. The pump placement in the wet well allows full capacity utilization of the water storage tank and simplifies installation. Wet wells are available in custom lengths and diameters to meet diverse application requirements.

WATER TREATMENT

Our Progressive Pump & Treatment systems are custom pumping and water treatment systems designed for commercial and industrial water reuse applications. The systems implement proprietary continuous and verifiable disinfection through our PLC-based pumping, treatment, and control systems. Our engineers transform your project concepts into a fully assembled, ready to install piece of equipment.

ADDITIONAL OPTIONS

UVS Systems

The RainFlo UVS systems are ideal where an easy-to-install, cost effective, reliable, complete system is desired for reclaimed water applications. Building on the field tested RainFlo products, each system includes a pump, VFD, sediment filtration, UV disinfection, and system controls to deliver disinfected water at a constant pressure and variable flow. RainFlo UVS systems are the best in their class and offer 25 GPM, 40 GPM, or 60 GPM to meet your specific needs. All systems are designed to fit through a standard 30" door.
